Introduction

We are pleased to submit this technical report to the Making Electoral Democracy Work team. Harris/Decima assembled a team of seasoned researchers from our Public Affairs team to work on this project. Their roles were as follows:

- Doug Anderson served as the Senior Project Manager. Mr. Anderson was responsible for overall project direction and ensuring the contractual obligations were met. He directed the project team, ensured quality control throughout the life cycle of the project and reviewed final deliverables.
- Danielle Armengaud served as Lead Consultant and the project analyst overseeing the overall management of the project, suppliers and sampling. Furthermore, Ms. Armengaud was the main point of client contact during the project.
- Sareda Quah served as Project Manager, being responsible for the day-to-day management of the project and acting as primary field liaison.

About Making Electoral Democracy Work

The Social Sciences and Humanities Research Council of Canada has awarded a significant grant for a seven-year research project entitled *Making Electoral Democracy Work (MEDW)* to Professor André Blais of the University of Montreal (Principal Investigator) and an international team of researchers.

This project brings together an exceptional team of economists, political scientists and psychologists from Canada, Europe, and the United States to undertake the most ambitious study ever undertaken on the impact of electoral rules on the functioning of democracy. The project will examine 27 elections in five countries.

The goal of the project is to examine the determinants of vote choice (including decision to vote or not to vote) in different election contexts.

Canadian Provincial Elections Surveys – Ontario

This report presents a detailed description of the survey methodology used to complete this research, including sample design, recruitment, survey administration, response rates, weighting and recommendations for the future.

This document contains all the details necessary to replicate this study in the future.

Number of Completed Surveys

Harris/Decima completed the following number of surveys, seen in the table below.

	Dates	Total # qualified completes
Ontario		
Pre-election survey	September 25 – October 5, 2011	1347
Post-election survey	October 7 – 20, 2011	896

These total numbers of completes exclude respondents who failed two or more In-Survey Quality (ISQ) Measures but includes respondents who failed only one. For more information, please see the section describing *In-Survey Quality Measures*.

Survey Methodology

Pre-launch

Questionnaire Design – CAWI

The MEDW team was responsible for providing the English and French versions of the pre and post election survey questionnaire.

Harris/Decima provided limited consultation on the questionnaire design to facilitate online survey administration. This survey was fielded in English and French and all translation of the survey instruments were provided by the MEDW team.

Programming

Once the survey was finalized, it was programmed by Harris/Decima's in-house programming team. Harris/Decima uses the *Confirmit Horizons Platform* software for data collection in online surveys. *Confirmit* includes support for random respondent selection, respondent identity verification via passwords (numeric passwords up to 12 digits) and quota control. It also features adaptive questionnaire logic designed to provide many of the same methodological safeguards associated with traditional CATI telephone interviewing (i.e., randomized ordering of variables being tested in a battery, skip patterns based on responses given). The package allows the project manager to track non-responses to survey requests and provides estimates of non-response bias.

Survey Pre-Tests

Prior to being finalized, the online surveys were pre-tested or slow started with approximately 20 respondents. After the slow start, Harris/Decima analysts checked all of the frequencies and skip logic to ensure it elicited the required information, before launching the full survey the following day.

Sample Design and Selection

The sample for this survey was designed to yield 1,000 complete pre-election survey interviews and a return-to-sample target of 750 interviews from the post-election survey. In an agreement with the MEDW team, any completes beyond the return-to-sample target of 750 within the agreed-upon field period were also included. A stratified, quota-based sampling approach was used, since this generates substantive estimates across and within specific key segments of interest, which in turn permits extrapolation to the broader population with greater confidence. Quotas were set by controlling for age, gender and education status.

Based on census statistics¹, the following demographic quotas were set for the pre-election surveys:

	Gender					
	Total - %	Total - Quota	Male - % of population	Male - Quota	Female - % of Population	Female - Quota
Total	100%	1000	48%	480	52%	519
Age						
18 - 34 years	28%	282	14%	139	14%	143
35 - 54 years	40%	399	20%	195	20%	204
55 - 99 years	32%	318	15%	146	17%	172

	Region		
	Postal Code (first letter)	Total - %	Total - Quota
Total		100%	1000
Ontario			
East	K	16%	155
Central	L	37%	369
Toronto	M	21%	205
Southwest	N	20%	201
North	P	7%	69

	Education	
	Total - %	Total - Quota
Total	100%	1000
High school or less	45%	446

¹ Source: Statistics Canada

College/CEGEP/Certificate	29%	286
University - Bachelor or less	18%	183
University Grad/Post-Grad	9%	85

Upon discovering a negative unintended consequence of the quota programming, quotas were opened up during the pre-election field period in order to reach the desired number of total completes within certain quotas during the field period.

The issue was that two independent quotas established were adversely affected by the rate of response based on the age of respondents. More specifically, quotas had been set for both age and education, but were independently managed. Since older respondents responded more rapidly and to a greater degree than their younger counterparts, it occurred that the quota for respondents with higher levels of education was filled by the time younger respondents were responding to the survey. Thus, the unintended negative consequence of this combination of factors was that younger respondents who would have qualified as highly educated were being declined participation on the basis of having filled the education quota. If the situation had remained unaddressed, the correlation of age and education would have created a sample profile that was less reflective of reality than desirable.

As a result, quotas for education were re-opened, allowing for younger, more highly educated respondents to be included in the sample, but simultaneously increase the overall sample size to 1,347 instead of the target of 1,000.

Weighting, approved by the MEDW team, was applied post-hoc to correct for this, as described in detail further on in this report.

Given that the post-election survey was a return to sample only, no quotas were set for this portion of this study.

Survey Administration

Sampling and Quota Control

Quotas were monitored daily by the Harris/Decima project manager and by the project team using a monitoring tool supplied by the Conformat survey platform (“Reportal”). Sample pulls and reminders were based on quota needs.

Sample was pulled based on the following criteria:

- Age greater than 18
- Language set to English or French

- Area set to Ontario
- Education levels
- Gender
- Canadian citizenship

For the post-election surveys, no further sample was pulled – invites and reminders were sent only to those who completed the pre-election survey.

Invites and Reminders

To complete the online survey, respondents were sent an invitation and clicked on a survey URL with an embedded password to be directed to the Harris/Decima site where the survey was hosted. The survey included an information and consent form which provided information about the study, encouraged their participation, provided them with the necessary privacy information and reiterated that by clicking “next” on the survey they consented to participation.

The survey was accessible 24 hours a day, seven days a week from any web-enabled computer.

Reminders were sent periodically to those who had not yet completed the survey.

Invites and reminders were sent by Harris/Decima as follows:

	Date	# Invites	# Reminders
Pre-election survey	September 25, 2011	2011	
	September 27, 2011	3646	
	September 28, 2011		2011
	September 29, 2011		3646
	October 3, 2011	5943	
	October 4, 2011	3431	
	October 5, 2011		5943
Total		15031	11600
Post-election survey	October 7, 2011	1125	
	October 9, 2011		1125

	Date	# Invites	# Reminders
	October 11, 2011	31	
	October 13, 2011		31
Total		1156	1156

Incentives

As is customary with all online panel surveys, participants were provided with an incentive upon the completion of the survey.

Respondents were given the choice of the following incentives for the pre-election survey:

- 100 HIpoints
- 75 Aeroplan miles

And for the post-election survey:

- 100 HIpoints
- 75 Aeroplan miles

Passwords

Each respondent had a unique password which was appended to the end of the URL. Cookies were enabled to control access to the survey so respondents could only complete the survey once.

Sample Distribution and Response Rate

The table below presents the overall participation rate for the pre-election and post-election surveys:

	Pre	Post
A: Total Invitations	15031	1156
B: Undeliverables	0	0
C: Net Usable invitations (A-B)	15031	1156
D: Total Completes	1347	896
E: Qualified break offs	204	65
F: Disqualified (ISQ)	11	1
G: Not responded	12758	192
H: Quota filled	723	0
Contact Rate (d+e+f+h)/c	15%	83%
Participation Rate (d+f+h)/c	14%	78%

All surveys are different and response rates do vary from project to project. In general, political surveys tend to have a lower response rate because they may ask for sensitive information on voting habits. As well, interest in politics and the length of this particular survey may have played a role in lower response rates.

Average lengths, once outliers were removed, were:

- Pre-election survey: 19 minutes
- Post-election survey: 11 minutes

The following table indicates how many completes were achieved each day. For a more detailed breakdown of these numbers by quota please see Appendix A.

Completions by Date: Pre and Post Wave

	Date	# Completions
--	------	---------------

Ontario			
Pre-election survey	Sunday, September 25, 2011	136	
	Monday, September 26, 2011	39	
	Tuesday, September 27, 2011	623	
	Wednesday, September 28, 2011	131	
	Thursday, September 29, 2011	28	
	Friday, September 30, 2011	8	
	Saturday, October 1, 2011	11	
	Sunday, October 2, 2011	3	
	Monday, October 3, 2011	19	
	Tuesday, October 4, 2011	209	
	Wednesday, October 5, 2011	140	
	Post-election survey	Friday, October 7, 2011	393
		Saturday, October 8, 2011	192
Sunday, October 9, 2011		111	
Monday, October 10, 2011		59	
Tuesday, October 11, 2011		86	
Wednesday, October 12, 2011		19	
Thursday, October 13, 2011		18	
Friday, October 14, 2011		3	
Saturday, October 15, 2011		2	
Sunday, October 16, 2011		2	
Monday, October 17, 2011		3	
Tuesday, October 18, 2011		4	
Wednesday, October 19, 2011		2	
Thursday, October 20, 2011		1	
Saturday, October 29, 2011 ²	1		

² On October 29, 2011, there was one completion. This respondent began the survey on October 10, 2011 and re-accessed and completed the survey on October 29. We have kept the responses and identified this respondent as a completion.

In-Survey Quality Assurance (ISQ)

Harris Interactive uses a multi-layered approach to ensure that fraudulent respondents, those who intentionally misrepresent themselves by providing inaccurate information, and/or those who misrepresent themselves as more than one individual by joining a panel under multiple email addresses, are detected and removed and do not affect client results.

As this study was conducted with Harris Decima's panel, which has been proven to be a very high-quality panel, we relied on our In-Survey Quality Assurance measures to ensure an extra "check" for bad respondents.

Respondents generally enter our surveys intending to participate as thoughtfully as we desire, but occasionally some will be pressed for time or will find a survey excessively long or burdensome. In those situations, some respondents may "speed" to complete the survey quickly.

In an effort to identify respondents who are speeding or appear unengaged in the survey, we have developed a series of ISQ metrics. They consist of the following:

- Minimum Length of Interview
- Incorrect response to respondent instruction
- Identification of straight-lining activity at a grid question
- Less than 5 characters at a mandatory open-ended response
- Illogical responses to survey questions

For this survey, the first three of these five metrics were utilized:

- Minimum length of interview for the pre-election study was set at 8 minutes and for the post-election study, at 2 minutes
- The respondent instruction question added early in the questionnaire was as follows:

“To ensure that your browser is downloading the content of this survey properly, please select the number four below.”

- One (1)
 - Two (2)
 - Three (3)
 - Four (4)
 - Five (5)
 - Don't know (9)
- Respondents giving the same answer for all questions in the Q28 (pre-election) and PQ26 (post-election) batteries were flagged as “straightliners.”

A respondent was disqualified if they “failed” two or more of these measures.

Data Analysis

Upon completion of data collection, Harris/Decima cleaned and weighted the data.

Data Validity and Integrity Checks

Our custom system immediately identifies cases where the interview length is unrealistically short, contradicts established facts or presents patterns of response deserving attention. As a result, we can determine whether a case should be excluded from the final sample if necessary. All of these checks are performed manually and cleaned out of the data in the back end of the project. Harris/Decima uses a checklist to ensure all data that is delivered to the client has gone through a rigorous quality control process. During this time Harris/Decima also cross referenced all IDs between the pre and post surveys to ensure all responses were valid. A few test cases were removed from the data. As well, postal code information was removed to preserve anonymity of participants. The postal code variable (SD4A) appears in the datafile but does not contain any data.

Data Cleaning

Harris/Decima analysts have considerable experience in cleaning data files, conducting statistical routines, producing tabular output, and weighting data to provide an accurate measure of the population as a whole.

The following are the basic steps taken when cleaning data files:

- Ensure that all coded questions have updated codes and multiple mentions do not have duplicate codes;
- Create all new variables as a result of programming;
- Confirm that all relevant variables are included in the data file;
- Final frequency check (for out-of-range values) and recodes created, including those for outliers;
- Verify that variable names and question numbers match the final version of the questionnaire; and
- Create and verify new variable creations (against source variables) as outlined in the analysis plan and perform spell check on all variables.

In addition to these generic rules, project specific requirements are also taken into account. It is also noteworthy that because the CAWI software controls the questionnaire flow and data entry, data are typically quite clean from the outset.

Additional Variables Created

Harris/Decima created a number of extra variables to assist the MEDW team in navigating and analyzing the data:

Time Stamps (Variables T_INT to T_PQ1_END2): The way that timing variables work in this study is that they each capture how long the survey has taken (in seconds) at the point the respondent crosses the variable. To analyze how long someone has taken between two timestamps, subtract the first time stamp variable from the second and this will represent how long it took the respondent to get from the first variable to the second. In order to convert to minutes, divide the outcome by 60.

Flags: Only one instance was found where respondents were exposed to question wording errors in the survey. Upon doing a frequency check after the soft launch of the pre-election survey, 132 respondents were found to be exposed to Q2 worded as “this election” rather than “the upcoming provincial election” (Q2: What is the most important issue to you personally in the upcoming provincial?). This may have affected a few survey responses. As such, they were flagged in the data.

Panel Information: Variables 375 to 421 contain information on the panel members who completed the survey that was gathered by Harris/Decima at an earlier date through a previous screening survey. It was appended to this datafile for research and analysis purposes. A second datafile was made available to the MEDW team containing the same variables for all survey non-respondents.

Section: The section variable aides in selecting the appropriate respondent group for analysis:

Value	Label	Segment
1	Pre-election complete	Those who only completed the pre-election survey
2	Pre-election incomplete	Those who started but did not complete the pre-election survey
3 (empty)	Post-election complete	Those who only completed the post-election survey
4 (empty	Post-election incomplete	Those who started but did not complete the post-election survey and who did not

)		complete the pre-election survey
5	Pre and post election complete	Those who completed both surveys
6	Pre complete and post incomplete	Those who completed the pre-election survey and started the post-election survey, but did not complete it
7 (empty)	Pre incomplete and post complete	Those who started but did not complete the pre-election survey and completed the post-election survey
8	Neither section started	Those who dropped out of the survey in the screening section before Q1

This variable can be recoded to select appropriate respondent groups for analysis. For example, (1 + 5 + 6) are all those who completed the pre-election survey.

Last question answered (lastq): indicates the last question an “incomplete” respondent answered before dropping out of the survey.

ISQ fail variables: Eight variables were created to indicate how respondents did on the in-survey-quality measures. As discussed, it is recommended to only exclude those who failed two or three of the measures. The two variables (one for the pre-election survey and one for the post-election survey) that identifies those respondents are bolded in the table below.

Variable	Segment	Pre or post survey
pre_grid	Straight line grid isq fail.	Pre
pre_resp	Respondent instruction isq fail	Pre
pre_time	Minimum length of survey isq fail	Pre
pre_fail	Failed two or more isq measures	Pre
post_grid	Straight line grid isq fail.	Post
post_resp	Respondent instruction isq fail	Post
post_time	Minimum length of survey isq fail	Post
post_fail	Failed two or more isq measures	Post

Electoral Constituency (elec_con): In the final data set, Harris/Decima appended all the electoral constituency information, based on postal codes provided by the respondents (variable SD4A) and information provided by MEDW.

Q1 and PQ1 combined variables (Q1A, Q1B, PQ1A, and PQ1B):

The Q1 and PQ1 batteries were split sample questions, meaning that half the sample received those questions at the beginning of the surveys and the other half at the end. These variables combine the answers from those two split samples for a base_all variable for each question in the battery.

Date variables: Two date variables were created; one for the pre-election study (**Pre_dat**) and one for the post-election study (**Post_dat**). These are the dates (day and month) that participants completed or otherwise exited (i.e. dropped out of) the survey.

Postal code (QT3): This variable contains only the first character of the postal code, which is how the regions in Ontario for weighting were defined.

Collapsed Education variable (QT4): This variable collapses the respondents' education level into three categories (low, middle and high – for details, please see section on quotas), and was used for weighting purposes.

Age by Gender (Age_gend): Collapsed age variable by gender, used to create weights.

Collapsed vote variable (Pre_vote): Created from Q6a and from Q8a and Q8b ONLY IF respondents are coded as voters in the likelihood to vote variable. This variable had to be created to combine respondents' vote intention because the questionnaire had vote intent in Q6A, Q8A, and Q8B. This variable was used for weighting purposes.

Collapsed vote variable (Post_vote): Created from PQ6, used to create weights.

Likelihood to vote (Pre_int): Created from Q6 and Q7 variable in order to identify who is likely to vote. Q6=1 OR ANY Q7= 1, 2, or 3 = Yes; all else is no.

Likelihood of having voted (Post_int): Created from PQ5_1 and PQ5_2 variables in order to identify who is likely to have voted. PQ5_1=4 OR PQ5_2=1 = Yes; all else is no.

Weighting

At the conclusion of the data collection and cleaning, Harris/Decima weighted the data by each quota stratum to reflect the actual proportions found in the population. This ensures the findings from the research can be extrapolated to the entire population with accuracy.

RIM weighting (Random Iterative Method - also called raking) was used to create weights. This method of weighting puts selected non-interlocking and grouped interlocking variables in isolation through an iterative sequence of weighting adjustments. The sequence adjusts for each rim in turn and then repeats itself as many times as is required in order to obtain a convergence, in which the sum of the weighted rims matches the target population estimates, or is as close as it is possible to achieve. The number of iterations is indicated in the table below.

Other conventional weighting methods could be used to weight survey data. In many cases, cell weighting (or post-stratification) is applied. This method is the simplest of ways to bring sample proportions in line with population proportions based on census data. It divides the population into a number of cells, such as two gender cells or three age cells. The proportion of the population in each cell is then divided by the proportion for each cell found in the final sample:

$$\text{Cellweight } (W) = \text{proportion in population in cell} / \text{proportion in sample in cell}$$

The main reason why this method was not used, was that the information for each desired cell was not available. As weights were based on interlocking information on age, gender, region, education, vote turnout and vote distribution, it was impossible to find correct population information to weight back to. For example, there is no published data available that would indicate the incidence in the Ontario population of women between the ages of 35 and 54 who have a university education, live in the postal-code zone starting with a K who voted for the NDP. Moreover, should this information have become available, the sheer number of cells would have made for small cell-sizes, risking very high or very low weights for certain populations.

RIM weighting, on the other hand, only uses marginal distributions, therefore allowing for more covariates. It was deemed a more appropriate and methodologically sound weighting method in this study.

The data used for the demographic weights were taken from the same sources as used for the quotas. The source of the official turnout and statistics were supplied to Harris/Decima by the MEDW team.

As a matter of convention, the average weight was set to 1 so that the unweighted base is the same as the weighted base.

Although weighting caps were set, these caps are not hard, but were instead capped by trimming and then after normalization the range in some instances moved slightly.

For more details, please see *Weighting Reports* in Appendix C.

The datafile includes the following weights:

Name	Factors	Use for Pre/Post	# iterations	Cap - low	Cap - high
------	---------	------------------	--------------	-----------	------------

PRE_WEIGHT 1	age, gender, education, and region	Pre	5	0.2	5
PRE_WEIGHT 2	age, gender, education, region, and likelihood to vote (vote turnout)	Pre	7	0.2	5
PRE_WEIGHT 3	age, gender, education, region, likelihood to vote (vote turnout), and vote intention (actual election results)	Pre	20	0.2	5

PRE_WEIGHT 3B ³	age, gender, education, region, and vote intention (actual election results)	Pre	7	0.2	5
PRE_WEIGHT 4 ⁴	age, gender, education, region, and vote intention (actual election results)	Pre	5	0.2	5
POST_WEIGHT T1	age, gender, education, and region	Post	5	0.2	5
POST_WEIGHT T2	age, gender, education, region, and likelihood to vote (vote turnout)	Post	4	0.2	5
POST_WEIGHT T3	age, gender, education, region, likelihood to	Post	20	0.2	5

3 Weights 3 and 3B are used to create weights that account, in addition to demographic attributes, for a respondent's likelihood to vote (whether they intend to vote at the time of the pre-election survey or whether they have voted at the time of the post-election survey) and whom they intend to vote for (in the pre-election survey) or who they have voted for (in the post-election survey). Weight 3 does this by using a separate rim for likelihood to vote and vote intent. Weight 3B, however, combines a respondent's likelihood and intent into a single rim by adding the code 'Non-voter' to the VOTE_COL variable and then setting the weight target for those respondents to the non-voter target based on election results while the vote intent targets are set based on election results multiplied by voter turnout. This method avoids voters being weighted up in the vote intent rim and then weighted down (equally) in the likelihood to vote rim, as each party's vote intent targets are only based on actual voter turnout.

4 Weights 3B and 4 use the same variables, but the weight target within those variables are different, so the weighting is different. Weight 3B uses weight targets that ensure the weighting accounts for both likelihood to vote and vote intent, where weight 4 only accounts for vote intent.

	vote (vote turnout), and vote recall (actual election results)				
POST_WEIGHT T3B3	age, gender, education, region, and vote recall (actual election results)	Post	4	0.2	5
POST_WEIGHT T44	age, gender, education, region, and vote recall (actual election results)	Post	5	0.2	5

Please note, if a respondent was identified as an ISQ fail, failing 2 or more checks, the values of the variables that were used for weighting were set to 'sysmis'. This is required since these variables were used for weighting and ISQ failed respondents are not included in the weighting.

Appendix A: Pre-election Surveys

Appendix B: Invitation E-mail and Information and Consent Screen

Invitation

Pre-election survey:

English:

Issues Impacting Canadians

We are interested in hearing your thoughts and opinions on issues impacting Canadians. The survey will only take about 20 minutes. You will be compensated with 100 HIpoints or 75 Aeroplan miles for completing the survey.

French:

Questions qui impactent les Canadiens

Nous sommes intéressés à connaître vos idées et opinions sur les enjeux d'actualité qui affectent les Canadiens. Il prend environ 20 minutes à compléter. Si vous complétez le sondage aujourd'hui vous gagnerez 100 Hipoints ou 75 milles Aéroplan.

Post-election survey:

English:

Issues Impacting Canadians

We are interested in hearing your thoughts and opinions on issues impacting Canadians. The survey will only take about 20 minutes. You will be compensated with 100 HIpoints or 75 Aeroplan miles for completing the survey.

French:

Landing Page

English:

Thank you for considering taking our survey. We are doing a research study about elections and democracy and we would like your opinions. Participation in the research is voluntary. Your answers will be kept completely confidential and will be used for research purposes only. You must be 18 years or older, a citizen of Canada and a resident of Ontario to participate.

The study has two parts. The first, which you are being invited to complete today, is a survey that will only take about 20 minutes to complete. The second part is another, shorter survey. If you participate today you will be re-contacted at a later date and invited to complete the second survey as well. Participation at that time will also be voluntary. If you would like to read additional information about this study, click [HERE](#).

If you would like to complete the survey now, without reading more information, please click the forward arrow to begin. By completing this survey you consent to participate in this study.

If you have questions at any time about the study, the conduct of this study or your rights as a research participant please contact one of the individuals listed on the Additional Information screen.

During the survey, please do not use your browser's FORWARD and BACK buttons. Instead, please always use the buttons below to move backward and forward through the survey.

French:

Merci de vous intéresser à notre sondage. Aujourd'hui nous effectuons la deuxième partie d'un projet de recherche sur les élections et la démocratie et nous aimerions vos opinions. Vous avez complété la première partie il y a quelques jours. La participation à cette partie de la recherche est complètement volontaire. Le sondage d'aujourd'hui prend environ 10 minutes à compléter. Vos réponses seront gardées complètement confidentielles et ne seront utilisées que pour des fins de recherche.

Vous devez avoir plus de 18 ans, être citoyen du Canada et un résidant de l'Ontario pour participer.

Si vous aimeriez lire des informations additionnelles sur cette étude, cliquez [ICI](#).

Si vous aimeriez commencer à compléter le sondage maintenant, sans lire plus d'information, veuillez cliquer la flèche pour débiter. En complétant le sondage, vous consentez à participer à cette étude.

Si vous avez des questions à n'importe quel moment par rapport à l'étude, la conduite de cette étude ou vos droits en tant que participant à la recherche, veuillez contacter l'un des individus mentionnés dans l'écran d'informations additionnelles.

Pendant le sondage, veuillez ne pas utiliser les boutons Précédent et Suivant de votre fureteur. À la place, veuillez toujours utiliser les boutons au bas de l'écran pour vous déplacer vers l'arrière et vers l'avant du sondage.

Cliquez simplement sur la flèche au bas de cette page pour débiter le sondage.

Additional Information

English:

The purpose of this screen is to provide you with information about the research study. You must be 18 years of age or older, a Canadian citizen and a resident of Ontario to be eligible to participate.

The purpose of the study is to obtain information about your views regarding elections and democracy. Participation in this study is voluntary. You may refuse to participate or end your participation at any time.

The study consists of two surveys. The first can be completed today. It will take about 20 minutes to complete. The second will be distributed after October 6, 2011. Should you complete today's survey, you will be re-contacted and asked to participate in the second survey as well. Participation today does not commit you to complete the next survey.

The benefit of participating in this study is that your responses will help us to know more about elections in Ontario. You may not benefit personally from your participation. There are no known risks associated with participating in this study.

If you complete the survey today you will be compensated with 100 HIpoints or 75 Aeroplan miles. Should you also complete the second survey, you will be compensated with an additional 100 HIpoints or 75 Aeroplan miles.

Your confidentiality will be maintained at all times.

If you have questions at any time about the study, you may contact:

Dr. Laura Stephenson
Department of Political Science
University of Western Ontario
London, Ontario, Canada
519-661-2111 ext. 85164
lstephe8@uwo.ca

If you have questions about the conduct of this study or your rights as a research subject you may contact:
Office of Research Ethics, UWO
519-661-3036

Completion of the survey indicates your consent to participate.

If you wish to participate in this first phase of the study, please close this window and click the forward arrow to begin the survey

French:

Le propos de ce message est de vous donner de l'information par rapport à l'étude. Vous devez être âgé de 18 ans et plus, un citoyen canadien et un résident de l'Ontario pour participer.

L'objectif de l'étude est d'obtenir de l'information sur vos opinions au sujet des élections et de la démocratie. La participation à cette étude est volontaire. Vous pouvez refuser de participer ou mettre fin à votre participation à tout moment.

L'étude consiste en deux sondages. Le premier peut être complété aujourd'hui. Il prend environ 20 minutes à compléter. Le second sera distribué après le 6 octobre 2011. Si vous participez à l'étude d'aujourd'hui, vous serez contacté plus tard et invité à participer au second sondage. Votre participation aujourd'hui ne vous force pas à participer au second sondage.

En participant à cette étude, vous nous aidez à mieux comprendre les élections en Ontario. Vous pourriez ne pas bénéficier personnellement de votre participation. Il n'y a pas de risques connus à participer à cette étude.

Si vous complétez le sondage aujourd'hui vous gagnerez 100 HIpoints ou 75 milles Aéroplan. Si vous complétez aussi le second sondage, vous gagnerez 100 HIpoints ou 75 milles Aéroplan.

Votre confidentialité sera maintenue à tout moment.

Si vous avez des questions à tout moment à propos de l'étude, vous pouvez contacter :

Dr. Laura Stephenson
Département de science politique
Université Western Ontario
London, Ontario, Canada
519-661-2111 ext. 85164
lstephe8@uwo.ca

Si vous avez des questions sur cette étude ou sur vos droits en tant que sujet de recherche, vous pouvez contacter le bureau de l'éthique en recherche, UWO 1-519-661-3036. Si vous avez des questions sur cette étude ou sur vos droits en tant que sujet de recherche, vous pouvez contacter :

Office of Research Ethics, UWO

519-661-3036

Compléter ce sondage indique votre volonté de participer.
Si vous souhaitez participer à la première phase de l'étude, s'il-vous-plaît fermez cette fenêtre et cliquez sur la flèche pour débiter le sondage.
